

3.03 Forces and Newton's Laws

3.03a	Newton's first law	a) Understand the concept and vector nature of a force. <i>A force has both a magnitude and direction and can cause an object with a given mass to change its velocity.</i> <i>Includes using directed line segments to represent forces (acting in at most two dimensions).</i> <i>Learners should be able to identify the forces acting on a system and represent them in a force diagram.</i>		MR1
3.03b		b) Understand and be able to use Newton's first law. <i>A particle that is at rest (or moving with constant velocity) will remain at rest (or moving with constant velocity) until acted upon by an external force.</i> <i>Learners should be able to complete a diagram with the force(s) required for a given body to remain in equilibrium.</i>		

OCR Ref.	Subject Content	Stage 1 learners should ...	Stage 2 learners additionally should ...	DfE Ref.
3.03c 3.03e 3.03d	Newton's second law	c) Understand and be able to use Newton's second law ($F = ma$) for motion in a straight line for bodies of constant mass moving under the action of constant forces. <i>e.g. A car moving along a road, a passenger riding in a lift or a crane lifting a weight.</i> <i>For stage 1 learners, examples can be restricted to problems in which the forces acting on the body will be collinear, in two perpendicular directions or given as 2-D vectors.</i> d) Understand and be able to use Newton's second law ($F = ma$) in simple cases of forces given as two dimensional vectors. <i>e.g. Find in vector form the force acting on a body of mass 2 kg when it is accelerating at $(4\mathbf{i} - 3\mathbf{j}) \text{ m s}^{-2}$.</i> <i>Questions set involving vectors may involve either column vector notation $\mathbf{F} = \begin{pmatrix} F_1 \\ F_2 \end{pmatrix}$ or $\mathbf{i}, \mathbf{j}$ notation</i> $\mathbf{F} = F_1\mathbf{i} + F_2\mathbf{j}$.	e) Be able to extend use of Newton's second law to situations where forces need to be resolved (restricted to two dimensions). <i>e.g. A force acting downwards on a body at a given angle to the horizontal or the motion of a body projected down a line of greatest slope of an inclined plane.</i>	MR2

OCR Ref.	Subject Content	Stage 1 learners should ...	Stage 2 learners additionally should ...	DfE Ref.
3.03f	Weight	f) Understand and be able to use the weight ($W = mg$) of a body to model the motion in a straight line under gravity. <i>e.g. A ball falling through the air.</i>		MR3
3.03g		g) Understand the gravitational acceleration, g, and its value in S.I. units to varying degrees of accuracy. <i>The value of g may be assumed to take a constant value of 9.8 ms^{-2} but learners should be aware that g is not a universal constant but depends on location in the universe.</i> <i>[The inverse square law for gravitation is not required.]</i>

3.03h 3.03l 3.03i 3.03j 3.03k 3.03m	Newton's third law	h) Understand and be able to use Newton's third law. <i>Every action has an equal and opposite reaction.</i> <i>Learners should understand and be able to use the concept that a system in which none of its components have any relative motion may be modelled as a single particle.</i> i) Understand and be able to use the concept of a normal reaction force. <i>Learners should understand and use the result that when an object is resting on a horizontal surface the normal reaction force is equal and opposite to the weight of the object. This includes knowing that when $R = 0$ contact is lost.</i> j) Be able to use the model of a 'smooth' contact and understand the limitations of the model. k) Be able to use the concept of equilibrium together with one dimensional motion in a straight line to solve problems that involve connected particles and smooth pulleys. <i>e.g. A train engine pulling a train carriage(s) along a straight horizontal track or the vertical motion of two particles, connected by a light inextensible string passing over a fixed smooth peg or light pulley.</i>	l) Be able to extend use of Newton's third law to situations where forces need to be resolved (restricted to two dimensions). m) Be able to use the principle that a particle is in equilibrium if and only if the sum of the resolved parts in a given direction is zero. <i>Problems may involve the resolving of forces, including cases where it is sensible to:</i> <i>1. resolve horizontally and vertically,</i> <i>2. resolve parallel and perpendicular to an inclined plane,</i> <i>3. resolve in directions to be chosen by the learner, or</i> <i>4. use a polygon of forces.</i>	MR4

OCR Ref.	Subject Content	Stage 1 learners should ...	Stage 2 learners additionally should ...	DfE Ref.
3.03n 3.03o	Newton's third law (continued)	n) Be able to solve problems involving simple cases of equilibrium of forces on a particle in two dimensions using vectors, including connected particles and smooth pulleys. <i>e.g. Finding the required force $\mathbf{F}$ for a particle to remain in equilibrium when under the action of forces $\mathbf{F}_1, \mathbf{F}_2, \dots$</i> <i>For stage 1 learners, examples can be restricted to problems in which the forces acting on the body will be collinear, in two perpendicular directions or given as 2-D vectors.</i>	o) Be able to resolve forces for more advanced problems involving connected particles and smooth pulleys. <i>e.g. The motion of two particles, connected by a light inextensible string passing over a light pulley placed at the top of an inclined plane.</i>	MR4
3.03p	Applications of vectors in a plane		p) Understand the term 'resultant' as applied to two or more forces acting at a point and be able to use vector addition in solving problems involving resultants and components of forces. <i>Includes understanding that the velocity vector gives the direction of motion and the acceleration vector gives the direction of resultant force.</i> <i>Includes being able to find and use perpendicular components of a force, for example to find the resultant of a system of forces or to calculate the magnitude and direction of a force.</i> <i>[Solutions will involve calculation, not scale drawing.]</i>	MR5

OCR Ref.	Subject Content	Stage 1 learners should ...	Stage 2 learners additionally should ...	DfE Ref.
3.03q			q) Be able to solve problems involving the dynamics of motion for a particle moving in a plane under the action of a force or forces. <i>e.g. At time t s the force acting on a particle P of mass 4 kg is $(4\mathbf{i} + t\mathbf{j})$ N. P is initially at rest at the point with position vector $(3\mathbf{i} - 5\mathbf{j})$. Find the position vector of P when $t = 3$ s.</i>
