

The aim of this module is show the impact Newtonian mechanics has on physics. The microscopic motion of atoms can be modelled using Newton's laws and hence provide us with an understanding of macroscopic quantities such as pressure and temperature. Newton's law of gravitation can be used to predict the motion of planets and distant galaxies. In the final section we explore the intricacies of stars and the expansion of the Universe by analysing the electromagnetic radiation from space.

In this module, learners will learn about thermal physics, circular motion, oscillations, gravitational field, astrophysics and cosmology.

5.1 Thermal physics

This section provides knowledge and understanding of temperature, matter, specific heat capacity and specific latent heat.

Experimental work can be carried out to safely investigate specific heat capacity of materials (HSW4). It also provides an opportunity to discuss how Newton's laws can be used to model the behaviour of gases (HSW1).

5.1.1 Temperature

Learning outcomes	Additional guidance
<i>Learners should be able to demonstrate and apply their knowledge and understanding of:</i>	
(a) thermal equilibrium	
(b) absolute scale of temperature (i.e. the thermodynamic scale) that does not depend on property of any particular substance	
(c) temperature measurements both in degrees Celsius ($^{\circ}\text{C}$) and in kelvin (K)	
(d) $T(\text{K}) \approx \theta(^{\circ}\text{C}) + 273$.
