

2.2 Techniques used to create animation with audio

Techniques used to create and edit animation

- Tools and techniques of animation creation software to generate and enhance movement
 - timelines
 - keyframes
 - tweening
 - layering
 - saving in native file format to help version control and editing

Techniques used to combine and edit digital audio to create soundtracks

- Tools and techniques of audio editing software to edit and combine sounds
 - cut, split, trim and extend soundtracks
 - use of multiple audio tracks within files
 - mixing sounds
 - enhancing sounds using effects
 - techniques to save and export audio files in formats which are compatible with animation software

Techniques used to integrate animation and audio components within animation software

- Tools and techniques of software to combine and synchronise animation with audio
 - layers
 - synchronisation
 - volume control
 - native file formats

To include:

- Using tools and techniques of animation creation software to generate and enhance movement e.g. timelines, time shift, tweening, keyframes, shape and motion tweening, animation by ones or twos, onion skinning, layering, rigging (bones/armatures), libraries, layers

Does not include:

- VR or AR animation tools and techniques

To include:

- Using features of audio editing software to
 - combine audio using multiple tracks
 - mix audio using time shift, equalisation, audio compression, looping, ducking, generating silence
 - enhance audio by applying effects and altering parameters including fade, balance, gain, compression and equalisation
- Saving and exporting audio considering file format, compression, optimisation, codecs and bit rate
- Saving and exporting audio for use as components in animation with audio

To include:

- Inserting audio into animation software as layers
- Using key frames, splitting and time shift to synchronise movement/visual action with sounds
- Editing volume and balance to make sure sounds are audible at appropriate levels
- Saving files in native software for further editing
- Synchronising visuals with finished audio 'soundtracks' by splitting and time shifting animated visuals
- Synchronising audio with visuals by inserting separate sounds as assets into the animation software to synchronise with completed visual content

Does not include:

- Live motion capture
- Lip sync using apps
