

## Topic B2:     Scaling up

---

### B2.1     Supplying the cell

---

#### Summary

Cells transport many substances across their membranes by diffusion, osmosis and active transport. Stem cells are found in both plants and animals. These stem cells can divide, differentiate and become specialised to form tissues, organs and organ systems.

#### Underlying knowledge and understanding

Learners should be familiar with the role of diffusion in the movement of materials in and between cells.

#### Common misconceptions

Learners commonly show some confusion regarding surface area: volume ratio, particularly how larger animals have a smaller surface area: volume ratio. They also show some confusion as to stem cells: where they are found and their roles. Care should be taken to give clear definitions when covering this content.

#### Tiering

Statements shown in **bold** type will only be tested in the Higher Tier papers. All other statements will be assessed in both Foundation and Higher Tier papers.
