

2.6 Issues and debates	Examples of issues and debates in cognitive psychology: • Ethics (e.g. Henry Molaison (HM) and confidentiality). • Practical issues in the design and implementation of research (e.g. how to measure memory and the validity of experimental design). • Reductionism (e.g. under-emphasis on the interconnections between parts of the brain in favour of individual parts responsible for memory; artificially breaking memory up into parts like Short-term Memory and Long-term Memory for the purposes of study). • Comparisons of ways of explaining behaviour using different themes (e.g. the different memory models). • Psychology as a science (e.g. laboratory experiments and controls). • Culture and gender (e.g. how memory is reconstructed based on cultural differences or gender stereotypes; or differences in digit span cross-culturally if studied Sebastian and Hernandez-Gil contemporary study). • Nature-nurture (e.g. Henry Molaison (HM) and brain function = nature, reconstructive memory emphasises experiences = nurture). • An understanding of how psychological understanding has developed over time (e.g. if studying the development of the working memory model over time; or how the multi-store model informed later memory models). • Issues of social control (e.g. perhaps using understanding of memory in court situations). • The use of psychological knowledge within society (e.g. using understanding of memory to help with memory 'loss', for example a memory bus). • Issues related to socially sensitive research (e.g. memory loss related to dementia is socially sensitive for the individual).
