

(d) Further summary statistics		
2d.01	Use different types of index numbers in context, including but not limited to retail price index (RPI), consumer price index (CPI) and gross domestic product (GDP).	Calculation and interpretation of simple index numbers is expected.
2d.02	Interpret data related to rates of change over time (including, but not limited to, percentage change, births, deaths, house prices, and unemployment) when given in graphical form. Calculate and interpret rates of change over time from tables using context specific formula.	Making predictions using rates of change formulae is expected, e.g. $\text{crude birth rate} = \frac{\text{number of births} \times 1000}{\text{total population}}$ Formula will be given.
