

|      |                                                                                                                                                                                                              |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7.2  | describe the structure of an atom in terms of protons, neutrons and electrons and use symbols such as $^{14}_6\text{C}$ to describe particular nuclei                                                        |
| 7.3  | know the terms atomic (proton) number, mass (nucleon) number and isotope                                                                                                                                     |
| 7.4  | know that alpha ( $\alpha$ ) particles, beta ( $\beta^-$ ) particles, and gamma ( $\gamma$ ) rays are ionising radiations emitted from unstable nuclei in a random process                                   |
| 7.5  | describe the nature of alpha ( $\alpha$ ) particles, beta ( $\beta^-$ ) particles and gamma ( $\gamma$ ) rays, and recall that they may be distinguished in terms of penetrating power and ability to ionise |
| 7.6  | <i>practical: investigate the penetration powers of different types of radiation using either radioactive sources or simulations</i>                                                                         |
| 7.7  | describe the effects on the atomic and mass numbers of a nucleus of the emission of each of the four main types of radiation (alpha, beta, gamma and neutron radiation)                                      |
| 7.8  | understand how to balance nuclear equations in terms of mass and charge                                                                                                                                      |
| 7.9  | know that photographic film or a Geiger–Müller detector can detect ionising radiations                                                                                                                       |
| 7.10 | explain the sources of background (ionising) radiation from Earth and space                                                                                                                                  |
| 7.11 | know that the activity of a radioactive source decreases over a period of time and is measured in becquerels                                                                                                 |
| 7.12 | know the definition of the term 'half-life' and understand that it is different for different radioactive isotopes                                                                                           |
| 7.13 | use the concept of the half-life to carry out simple calculations on activity, including graphical methods                                                                                                   |
| 7.14 | describe uses of radioactivity in industry and medicine                                                                                                                                                      |
| 7.15 | describe the difference between contamination and irradiation                                                                                                                                                |

| <b>Students should:</b> |                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7.16                    | describe the dangers of ionising radiations, including: <ul style="list-style-type: none"> <li>• that radiation can cause mutations in living organisms</li> <li>• that radiation can damage cells and tissue</li> <li>• the problems arising from the disposal of radioactive waste and how the associated risks can be reduced</li> </ul> |

| <b>(c) Fission and fusion</b> |                                                                                                                                                                                     |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Students should:</b>       |                                                                                                                                                                                     |
| 7.17                          | know that nuclear reactions, including fission, fusion and radioactive decay, can be a source of energy                                                                             |
| 7.18                          | understand how a nucleus of U-235 can be split (the process of fission) by collision with a neutron and that this process releases energy as kinetic energy of the fission products |
| 7.19                          | know that the fission of U-235 produces two radioactive daughter nuclei and a small number of neutrons                                                                              |
| 7.20                          | describe how a chain reaction can be set up if the neutrons produced by one fission strike other U-235 nuclei                                                                       |
| 7.21                          | describe the role played by the control rods and moderator in the fission process                                                                                                   |
| 7.22                          | understand the role of shielding around a nuclear reactor                                                                                                                           |
| 7.23                          | explain the difference between nuclear fusion and nuclear fission                                                                                                                   |
| 7.24                          | describe nuclear fusion as the creation of larger nuclei resulting in a loss of mass from smaller nuclei, accompanied by a release of energy                                        |
| 7.25                          | know that fusion is the energy source for stars                                                                                                                                     |
| 7.26                          | explain why nuclear fusion does not happen at low temperatures and pressures, due to electrostatic repulsion of protons                                                             |

## **8    Astrophysics**

The following sub-topics are covered in this section.

- (a)    Units
  - (b)    Motion in the universe
  - (c)    Stellar evolution
  - (d)    Cosmology
-
